Project Charter Document

VITALSYNC HEALTHCARE INTEROPERABILITY & OVERSIGHT SIMULATION

ALEJANDRA BADIA

DOCUMENT REVISION LOG

REV.	UPDATE DATE	BY
1	FEBRUARY 27, 2026	ALEJANDRA

1. Objective

Design a prototype observability platform to improve visibility into system health, data flows, and interoperability across multi-layer healthcare systems, including clinical, integration, reporting, and research domains.

The platform simulates these system layers to reflect real-world healthcare interoperability environments and enable monitoring across operational and integration workflows.

2. Scope

In Scope:

- Simulated HIS relational schema
- HL7-style event logging and validation
- FHIR R4 API integration
- KPI monitoring dashboard
- Denormalized executive reporting table
- Governance awareness layer

Out of Scope:

- Real PHI storage
- Production deployment
- Authentication/role enforcement

3. Stakeholders

- Clinical Users
- Technical Project Manager
- Integration Vendor
- Compliance Officer

- IT Operations
- Executive Leadership

4. Deliverables

- Multi-dashboard web platform
- SQL data model
- Integration logging layer
- Reporting abstraction table
- Documentation package

5. Constraints

- Public FHIR API dependency
- Local MySQL environment
- Simulated HL7 (not real message parsing)
- Limited dataset size

6. Assumptions

- All clinical data is simulated
- HL7 events represent interface behavior
- FHIR API availability is non-guaranteed
- Governance model is illustrative
